Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

             The present invention provides the protein and coding sequences of human thiorblast growth factor-1 (FGG-1) and a mutant that is resistant to thrombin degradation. The thrombin degradation resistant FGF-1 protein can be used for treating a disease or disorder (e.g. myocardial ischaemia, peripheral vascular disease, cerebral ischaemia, epithelial injury, nerve injury, or bone damage), for enhancing the effectiveness of an FGF-1 response, or for stimulating an FGF-1 response in a mammal. The present sequence is the mutant FGF-1
                                                                                                                                                                                                                                                                                                                                                                                                                                  9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             To screen the human brain stem cDNA library for clones contg. ECGF inserts, a specific oligonucleotide was designed. This oligonucleotide was based upon a maino terminus of ECGF (see AAP70480 and AAP70481). Fig 3c sets forth for comparison the AA sequence of cyanogen bromide-cleaved bovine alpha and beta ECGF (AAP70834). The two clones that were isolated, ECGF clones 1 and 29, were analysed in further detail. The nucleotide sequence of these clones and the AA sequence deduced from the nucleic acid sequence is shown in Fig 8 (see AAN70788 and AAP70482). (Updated on 25-MAR-2003 to correct PA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   240

Bovine beta-endothelial cell growth factor (beta-ECGF; AAW03999) having a mol.wt. of 20 kD can be purified at least 16300 fold from bovine brain using heparin-Sepharose affinity chromatography. ECGF is useful for, among other purposes, diagnostic applications and has potential in the treatment of damaged blood vessels or other endothelial cell-lined structures. Human ECGF (AAT37503) or fragments may be obtained using oligonucleotides (AAT37504 and AAT37508 to AAT37509) whose design is based on the sequence of bovine alpha- and beta-ECGF. (Updated on 25-WAR-2003 to correct PP field.)

This sequence represents the complete cDNA sequence encoding both human alpha— and beta—endothelial cell growth factors (EGGF, AANY313-W7514). The sequence was isolated from a human brain stem cell cDNA library using a probe designed based on fragments of the bovine ECGF (see AAN75416-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              factors (ECGF) and plasmids comprising the DNA sequences. The DNA encodes a cleavable signal peptide and an ECGF, where removal of the signal peptide yields a mature form of the ECGF, where the ECGF is alpha-ECGF or beta-ECGF. The DNA is used to produce recombinant ECGF proteins, which can be used in treatments to repair or regenerate blood vessels or other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CCTTCACAGCCCTGACCGAGAGTTTAATCTGCCTCCAGGGAATTACAAGAAGCCCAAAC 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      900
                                The present invention provides the protein and coding sequences of human that ast growth factor-1 (RGF-1) and a mutant that is resistant to thrombin degradation. The thrombin degradation resistant FGF-1 protein can be used for treating a disease or disorder (e.g. myocardial ischaemia, peripheral vascular disease, cerebral ischaemia, epithelial injury, nerve injury, or bone damage), for enhancing the effectiveness of an RGF-1 response, or for stimulating an RGF-1 response in a mammal. The present sequence is the wildtype FGF-1
                                                                                                                                                                                                                                                                                                                                            9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       59
Recombinant human endothelial cell growth factors - for treating damaged
                                                                                                                                                                      A cDNA clone (AAT45985) codes for human endothelial cell growth factor (AAM66818). To obtain the clone, a human brain stem cDNA library was screened with a probe (see also AA45986) based on N-terminal sequences of bovine ECGF (see also AAW06819-20). ECGF clones 1 and 29 were isolated, subcloned into M13mp8 and the ECGF open reading frame and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     181 GGGACAAGGACGGACCGACCACATTCAGCTGCAGCTGCGGAAAGGGTGGGGG

This invention relates to a combination comprising several cDNAs that are differentially expressed in activated vascular tissue. The invention also discloses a high throughput method for detecting differentially expressed cDNAs in a sample. The cDNAs of the invention may have antiatteriosclerotic, cytostatic, cardiant, hypotensive, antidiabetic; gynaecological, vasotropic and exebroprotective activities and may be used in gene therapy. The cDNAs of the invention may be used in a high-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     25-FEB-2003
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  26-SEP-2002.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Bandman 0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ABX63225;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  RESULT
```

diagnosing, staging, treating, or monitoring the progression of treatment of a vascular disease, e.g. atherosclerosis, cancer, coronary artery disease, hypertension, diabetes, pre-eclampsia, ischaemia-reperfusion injury, restenosis, or stores. The CDNAs can also be used for large-scale genetic or gene expression analysis of several new nucleic acid molecules. Antibodies to the proteins encoded by the CDNAs are useful for of the protein. The present sequence represents a cDNA of the invention that is differentially expressed in activated vascular tissue. Note: The sequence data for this patent did not form part of the specification, but was obtained in electronic format directly from USPTO at invention. A protein encoded by the CDNA may be used to screen several molecules or compounds to identify a ligand that specifically binds to the protein, or to produce or purify an antibody to the protein that can be used to detect a protein in a sample or purify a natural or recombinant protein from a sample. The nucleotides may be useful for diagnosing pre-pathologic disorders, and chronic or acute diseases associated with abnormalities in the expression, amount or distribution expression of one or more throughput methods for detecting differential expression of one or mor cDNAs in a sample, or screening several molecules or compounds to identify a molecule or compound that specifically binds a cDNA of the http.seqdata.uspto.gov/sequence.html?DocID=20020137081

The pleasment retails the 17 phage gene 10 promoter and transcriptional terminator for expression of heterologous proteins e.g. basic fibroblast growth factor. The novelty of heterologous proteins e.g. basic fibroblast growth factor. The novelty of plasmid darives from the inclusion of the plasmid stability region of plasmid RPA. This region allows maintenance of the plasmid and prevents plasmid loss without the need for antibiotic resistance genes for selection and maintenance. The RPA par region comprises the genes for by. C. D and E. They are placed in the plasmid under control of the laco operator and laci(g) repressor. The novel plasmid can be used to express proteins of pharmaceutical, agricultural or biocatalytic interest without the use of antibiotics in the culture medium which, when present in trace amounts in final preparations, could lead to undesired side effects or antibiotic resistant microorganisms flourishing Expression plasmids contg. phage T7 promoter - and stabilising par region from plasmid RP4. 228 CHICCGGATGGCACAGTGGATGGGACAGGACAGGACGACCAGCACCATTCAGCTGCAG 287 99 GGGAATTACAAGAAGCCCAAACTCCTCTACTGTAGCAACGGGGGCCACTTCCTGAGGATC 158 168 GGGAATTACAAGAAGCCCAAACTCCTCTACTGTAGCAACGGGGGCCACTTCCTGAGGATC 227 159 CTTCCGGATGGCACAGTGGATGGGACAAGGGACAGGGGGCGACCAGCACATTCAGCTGCAG 218 Expression vector; I') phage; gene 10; promoter; heterologous; circular; transcriptional terminator; plasmid stability region; RP4; maintenance; plasmid loss; anthiotic resistance; selection; pharmaceutical; agricultural; biocatalysis; ds. This is the nucleotide sequence of a novel expression plasmid derived from the pET series of expression vectors. R3 promoter from E. coli - having high strength and being insensitive to catabolite repression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence is referred to in the spec. as both Figure 10 and Figure 11. The 5' portion of the gene was provided by genomic lambda HAG-9.1 clone. This portion encodes the 15 amino acids of the pro sequence along with the first 25 amino acids of the mature 'primary' form of hargp. The remainder was constructed from synthetic oligo- nucleotides designed so as to yield the same nucleotide sequence as that reported for hargp cDNA by Jaye et al with 2 exceptions. One (see FT) was designed to destroy the Nocl site spanning codon 67 and the other was designed as as to add HindIII and EcoRI cleavage sites following the TRA termination codon. Neither of these changes affects the amino acid sequence encoded. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                a transcription initiation sequence; a second nuclectide sequence to terminate transcription; a third sequence comprising a ribosomal binding site and translation initiation codon operably linked to 13, a fourth sequence encoding a heterologous structural gene (eg AAN9994); a fifth sequence of an A-T rich oligomer; and a sixth sequence which is an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      synthetic gene is inserted into pAL12 and pAL13 making pAL12-harGF and pAL13-harGF respectively. It is part of a construct comprising: a first nucleotide sequence comprising an E. coli 13 promoter operably linked to

                The invention relates to inhibiting expression of a target gene (I) in a cell by introducing an inhibitory RNA (dsRNAI) having a double-stranded structure of at most 49 consecutive bases. At least part of one strand (as1) of dsRNA1 is complementary to (I) and at least part of one strand has an overhang of 1-4 nucleotides. The method is used to inhibit the expression of a wide range of genes, e.g. oncogenes, cytokine genes etc. in humans, also genes in plasmodium or in viruses or viroids that are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Double stranded RNA; dsRNA; RNAI; RNA inhibition; cytostatic; virucide; profozoacide; gene expression; antisense; tumour; infection; Plasmodium; virus; viroid; anti-tepp; human; HIV; human immunodeficiency virus; Hepatitis C virus; human papilloma virus; gene; ds.
                                                                                                                                                                   pathogenic for humans, animals or plants. Introducing an overhang into daRMA greatly increases effectiveness for inhibiting gene expression, both in vivo and in vitro and also increases stability and thus the effective concentration inside the cell. The present sequence is that o

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to inhibiting expression of a target gene in a cell by introducing at least two oligoribonucleotides (dsRNAI and II), both with a double-stranded (ds) structure of at most 49 sequential nucleotide pairs. At least part of one strand (31, 22) of the ds structures in each of dsRNAI and II are complementary to regions in the target gene. The method uses antisense inhibition of gene expression using double stranded RNA inhibition (RNAi). The method is particularly used to treat tumours or infections, especially by Plasmodium or viruses/viroids (pathogenic on humans, animals or plants). The method provides more effective inhibition of expression than known methods using a single dsRNA, even at very low concentrations. When dsRNA has at least one unpaired nucleotide at the end, stability (and thus effective concentration in the cell) is improved
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CTCAGTGCGGAAAAGCGTGGGGGGGGTGTATATAAAGAGTACCGAGACTGGCCAGTACTTG 240
                                                            Inhibiting expression of target genes, useful e.g. for treating tumors, by introducing into cells two double-stranded RNAs that are complementary
                                                                                                                                                                                                                                                                                           and efficiency can be increased further by pretreating the cells with interferon. The present sequence is that of a target DNA of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                              99 GGGAATTACAAGAAGCCCAAACTCCTCTACTGTAGCAACGGGGGCCACTTCCTGAGGATC 158
